

Manually Uploading Files to a Version

Overview

Files can only be uploaded to a version and only by the owner of the package to which the version belongs. Empty files cannot be uploaded to Bintray. Upload file size may be limited depending on your account plan.

Uploading a File to a Version

To upload a file to a version:

1. Access the **Version** page of the relevant version.
2. Click the **Upload Files** link under the version name.

The **Upload Files** form opens as part of the Version page (instead of the tabs).

The screenshot shows the Bintray interface for a version page. At the top, there's a green navigation bar with the 'JFrog Bintray' logo, a search bar, and user information for 'nurielrotem'. Below this, the breadcrumb path is 'freeworld / Repository1 / package1 / 1.0'. The page indicates it's owned by 'freeworld' and has a '5-star' rating. A message states 'This version has no description yet. Add a description now ...' with a 'SET ME UP!' button. The 'Upload Files' section contains a 'Target Repository Path' input field, a note about directory creation, and an 'Attached Files' section. The 'Attached Files' section includes a 'Save Changes' button, a 'Cancel' button, a 'Click to Add Files...' link with a note that 'compressed archives may be auto-extracted', a 'Drag files here' area with a green arrow icon, and an 'Upload from URL' section with an input field and an 'Upload' button.

3. There are three ways to upload files:

- a. Click the **Click to Add Files** link and select the file or files (multiple selection is allowed) to be uploaded through the browse dialog box that opens.
- b. Drag-and-drop the files onto the **Drag Files Here** area.
- c. Enter the URL of the file you want to upload in the **Upload from URL** field and click the **Upload** button.

- Every file is uploaded to a default directory in the relevant repository. The subdirectories, however, may be changed by the user, for convenience in managing multiple files under the same version. You may add in the field **Target Repository Path** the path to which you want the file to be uploaded, if you want to place the file in a subdirectory relative to the repo's root directory.

Note: as part of the advanced support that Bintray provides to Maven files, if the files you are uploading are of a Maven project (only Maven), Bintray automatically determines the target repository path according to the POM file (which must be included, according to Maven standards). Bintray offers you the option of assigning to the uploaded files the path as determined by the POM file. This is recommended but not mandatory.

Click [here](#) for more information about POM files.

- When there are files uploaded to the version, they are displayed as a list in the Upload Files form. Note, though, that the uploading is not final yet. You must click **Save Changes** in order for the files you uploaded to actually be stored within the version

The files are now uploaded and saved.

In order for your files to be visible to users, they need to be [published](#). Files that are successfully uploaded are not automatically published by Bintray; you need to publish them yourself. Following successful upload, a message box with the option to **Discard** or **Publish** the files appears.

- Discard** the files means undoing the upload you did just now.
- Publish** the files means making them available to be viewed and downloaded by all Bintray users

You can now navigate out of the current page, but remember, files can only remain unpublished for a period of 24 hours. If you do not publish them within that time, Bintray will automatically discard them. You can identify new files that have been uploaded but not published since their icon is displayed with a green dot.

Name	Creator	Updated	Size	
.	-	-		
 Links.txt	nurielirotem	a few seconds ago	807 B	 Actions 

Note that if the files are uploaded to a version of a package that belongs to a repository within an [organization](#), another member of the organization may view and publish the unpublished files, if that member has the correct [authorization](#) within the organization.
