

# Authentication Using Single Sign-On

## Overview

SSO is automatically enabled for all the JFrog services that use an Authentication Provider for managing security.

When SSO is applied, the user logs in to the JFrog product using a set of predefined credentials and is granted access across the board to the JFrog products. SSO eliminates the need to re-enter the credentials every time a product is accessed.

## Bypassing the SSO Process

If for any reason you are unable to log in using SSO, or if you wish to login with your Service's "Internal Admin", you can bypass the SSO mechanism by accessing the Service's backdoor URL: <http://localhost:8080/goto/login>.

Requires an  
**Enterprise+ license**
